

Energy Moves Through Living Things

Energy moves from the sun to the plant to the rabbit to the fox. Each living thing uses some energy and gives some off as heat. In the dashed space above each living thing, draw wavy arrows to show heat leaving it. Label them heat.

1. Where does the plant get its energy?

2. The fox gets less energy than the plant took in from the sun. Use your model to explain why.

3. What does this model leave out?
